CAESAR CIPHER ALGORITHM

Guided by
DR.E.Anbalagan

Presented by
Susidharan. V
192521387

Introduction

- Caesar Cipher is a basic encryption method.
- It converts readable text (plaintext) into secret text (ciphertext).
- Every letter is shifted by a fixed number of positions.
- The key decides how many positions each letter moves.
- It is widely used for educational purposes to learn encryption concepts.

Working of Caesar Cipher

- Write the plaintext.
- Choose a key (Example: 3).
- Shift every letter forward by the key value.
- The new letters form the ciphertext.

Example

Plaintext: HELLO

Key = 3

Ciphertext: KHOOR

Advantages & Disadvantages

Advantages

- Very simple to understand.
- Easy to implement.
- Fast encryption.

Disadvantages

- Only 26 possible keys.
- Can be broken using brute force.
- Not secure for modern communication.

Conclusion

- Caesar Cipher is the simplest classical encryption algorithm.
- It replaces each letter with another letter by shifting positions.
- It is useful for learning cryptography basics but is not secure today.

Thank you
